**Paper Abstract:** SNA bank output measurement method has not become definitive yet. Although bank companies are market producers, SNA bank output data have been provided by imputation, i.e., hypothetical estimation method. Since SNA bank output measurement method has been hypothetical, every SNA(1953, 1968, 1993, 2008) could not help altering the bank output measurement method. This phenomenon is a serious matter not only for economic data per se but also for the research tool of economic problem. In this paper, first, I develop logically the cause of fault in SNA bank output measurement method, and then I propose the objective bank output measurement method to substitute for SNA bank output measurement method.
